

WHAT IS ACT?

The ACT charger products redefine how users charge and manage batteries and ultimately bring costs savings to bear, particularly those with large fleets. The ACT product range uses a unique and patented form of charging and has found particular success in Europe and the US. All ACT chargers offer the following benefits:

- Fastest charge times in the two-way radio market - 1200mAh NiCD charges woe to go in around **35 minutes**.
- Batteries are conditioned as they are charged - this extends the life of a battery by a **minimum** of 2 times in an operational environment (lab tests have shown up to 5 times).
- No user discipline required - batteries can be placed on and removed from the charger at anytime without detriment to the battery. Batteries can be topped up and removed before a full charge cycle is complete, again without any detriment.
- No periodic conditioning or maintenance regimes are required.
- Marginal capacity in-service batteries can be recovered using these chargers - the unique charging scheme breaks down chemical build ups within the cells that shorten battery life.
- Finally, the chargers use a common base unit with radio and battery specific adaptors, this means that customers upgrading fleets can do so cost effectively by simply replacing adaptors.

In addition, the **iGuage** adds a level of analysing and battery recovery functionality.
